Test_ID	Module	Test Scenario	Pre-Requisite	Test Data	Priority	Steps	Expected Results	Edge Cases	Risk Captured	Automation Feasibilty
TC_01	HomePage	Product is visible on hompage with updated price	Frontend, product catalog, currency, and image-provider services are healthy	NA	P0	1. Open the homepage 2. Note several product names and prices 3. Change the currency from USD to EUR, then refresh 4. Open a product and return to the homepage.	1. Products and images load 2. Prices convert rather than merely changing the currency label in API response 3. EUR remains selected after refresh	1. Slow network - CDN not configured accordingly 2. Caching is cleared during user interaction	A stale price, wrong currency, or broken product list can mislead customers before checkout	Yes
TC_02	Cart	Update Cart post refresh and validate cached state	Start with an empty cart and note the selected currency	NA	P0	1. Add one product with 2 quantity 2. Add a different product 3. Open the cart, change a quantity 4. Refresh, and open the cart in another tab 5. Empty the cart and refresh again	1. Quantities and totals reflect each change and remain consistent after refresh 2. The empty cart remains empty 3. The cart UI should not show stale data after an update	Double-click Add, rapid quantity changes, switching currency with items already in the cart, or briefly losing connectivity during an update Max. quantity and checkout- payload limit	Frontend cache and backend cart diverge, causing duplicate items or incorrect totals	Yes
TC_03	Checkout	Successful checkout and order summary	Cart contains two different products, with one quantity greater than one	Test Payment card details required	P0	1. Select EUR, go to the cart, enter valid shipping/contact details 2. Place the order 3. Review the confirmation page, then return to the cart	1. An order ID appears; address, products, quantities, shipping cost, and total match the submitted order and selected currency as well as in DB. 2. Checkout clears the cart	Blank required fields, malformed card number/CVV, expired card, December expiration selection, and totals involving fractional cents.	Order value or currency are wrong, checkout accepts invalid data, or the order succeeds while the cart remains populated. Also verify the month selector: its December option currently appears to be labeled “January” in CheckoutForm	Yes
TC_04	Payment	Payment decline and recovery	Test payment gateway enabled for QA env.	Test Payment card details required	P0	1. Submit an order such that it fails 2. Retry with checkourt form intact 3. Order successful	1. The declined attempt does not show a completed order 2. The cart remains available 3. The page shows a clear, recoverable error 4. Retrying succeeds without duplicate charges or orders 5. Idempotency is maintained 6. Payment gateway records the failure and in house ledger as well 7. Different transaction id with same order id 8. Check quantity of products	1. Repeated submission while the first request is pending 2/ Distinguish a payment decline from a product-catalog/internal failure 3. Race around condition for product quantity 4. Handshake b/w payment gateway and our internal api's	The API returns a payment error, but the UI may not handle it gracefully. Treat an unhandled error, lost cart, or false confirmation as a release blocker. Reset the flag after the test. The existing API-level scenario is in CheckoutPaymentFailure	Partially, yes
TC_05	Fulfillment	Kafka order processing and recovery	Accounting, and fraud detection services are up Consumers are healthy	Kafka connection and topic details	P0	1. Place a valid order and confirm the normal order-complete page 2. Check service logs or telemetry to verify checkout published the order and both consumers processed it 3. Repeat with a consumer temporarily stopped, then restart it and check whether processing catches up 4. If safe in the test environment, replay an event to check duplicate handling	1. UI’s order result is consistent with the documented contract 2. Downstream processing eventually completes 3. Replay does not create duplicate business records or side effects 4. Check DB and Kafka topics as well	Kafka unavailable at publish time, consumer outage, delayed processing, and duplicate delivery	If downstream processing is required for a valid order, confirm there is durable retry/recovery and no silent loss before shipping OOS: Return, Partial Return, Item lost, not delivered ...etc states	Need Kafka integration, yes
